

LinkFixerPlus™ for Microsoft® Access

Automatically fix links when you move or rename files!

Product Data Sheet

Do you need to move or rename Microsoft Access files that contain links to other files?

Many Microsoft **Access** files contain links to other files including Excel links, image links, hyperlinks and links to other Access files. As soon as these files (or the folders they reside in) are moved or renamed, broken links occur. Thus we have the question of how to handle this problem during data migrations.

If moving or renaming a file or a folder causes only a few broken links, the problem is not severe. You can manually open each file and fix each broken link one by one. But what if moving or renaming files or folders would cause tens, hundreds or thousands of broken links?

Introducing *LinkFixerPlus for Microsoft Access*

This is the problem that LinkTek's patent-pending product, *LinkFixerPlus for Microsoft Access*, solves. Using *LinkFixerPlus for Microsoft Access*, you can easily move or rename Access files, and any files they link to, in batch, and have all of the links maintained totally automatically!

In addition, *LinkFixerPlus for Microsoft Access* can fix — either semi-automatically or fully automatically — broken links caused by files that were previously moved or renamed.

What else can *LinkFixerPlus* do?

In addition to moving or renaming files without causing broken links, *LinkFixerPlus* can:

- **Produce detailed reports:** *LinkFixerPlus* generates a variety of detailed reports showing parent files, the links pointing to child files and the status of each of the links. The reports enable you to easily view links contained within supported parent file types and quickly identify which links are broken.
- **Repair links fully automatically:** Once you run *LinkFixerPlus'* Inoculate command on a set of Access files, links in those files that later become broken can be fixed totally automatically — at the push of a button!
- **Repair links semi-automatically:** You can repair broken links quickly and easily in large sets of files

LinkFixerPlus' main functions: Reports, Inoculate, Move/Rename and Cure

Product Data Sheet — page 2

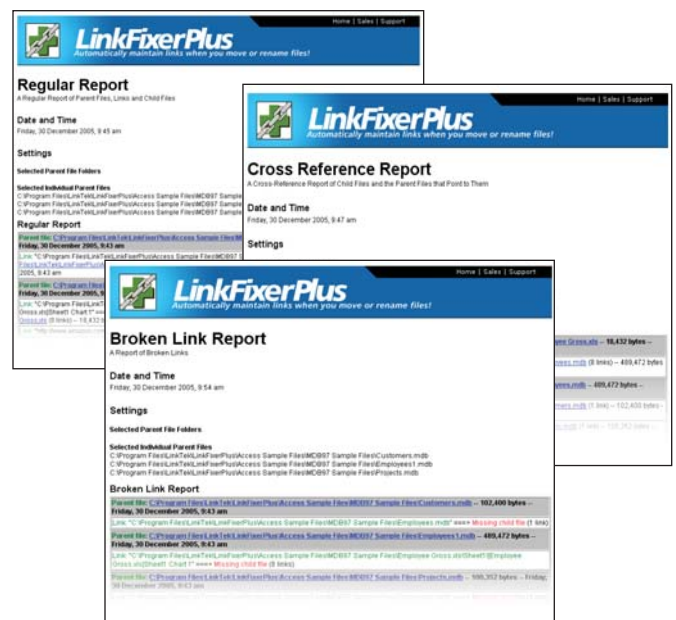

— even in files that have not been inoculated — by executing simple, but powerful global search and replace commands to modify the names of folders or files stored in link paths.

LinkFixerPlus — benefits at a glance

LinkFixerPlus for Microsoft Access gives users the ability to:

- Rename or move linked files, in batch, using sophisticated rename rules, without causing broken links in the files that point to them.
- Safeguard healthy links in files, allowing them to be automatically repaired should they become broken.
- Fix broken links in safeguarded files totally automatically.
- Generate a broken link report listing all files containing broken links, so they can be fixed before causing problems.
- Generate a regular report listing each file followed by a list of the files it links to.
- Generate a cross-reference report listing each linked file followed by a list of all the files that point to it.
- Report whether a file is being pointed to by any Access file anywhere on a user's system, thereby letting the user know whether the file is safe to delete.
- Fix broken links in large sets of files with a single command using sophisticated global search and replace operations.

Using *LinkFixerPlus for Microsoft Access*, you can quickly, easily and dependably maintain the integrity of all the links contained within your Access files, even when working with large numbers of files such as during data migrations.

LinkFixerPlus for Microsoft Access offers detailed reports of links contained within Microsoft Access files.
