

# LinkFixerPlus™

## Fix broken links automatically!

### Product Data Sheet

#### LinkFixerPlus — Fix broken links in Web sites automatically!

LinkFixerPlus is the world's first program that fixes broken links in local copies of Web sites TOTALLY AUTOMATICALLY! It's like having your own automated robot that can magically restore broken links between most popular file formats used on the Web today.

This innovative application has been developed for Web professionals to help eliminate the need to manually find and fix broken links.

If you are a Web professional charged with maintaining the link integrity of small or large sites, LinkFixerPlus is the first software application that can give you freedom from manually locating and repairing broken links.

LinkFixerPlus is a new and unique solution that automates these tedious and time-consuming tasks for you, minimizing your workload and maximizing the integrity of your links.

LinkFixerPlus helps to do away with the problem of lost customers and lost revenues due to Web pages pointing to broken links.

#### First in automatic link repair

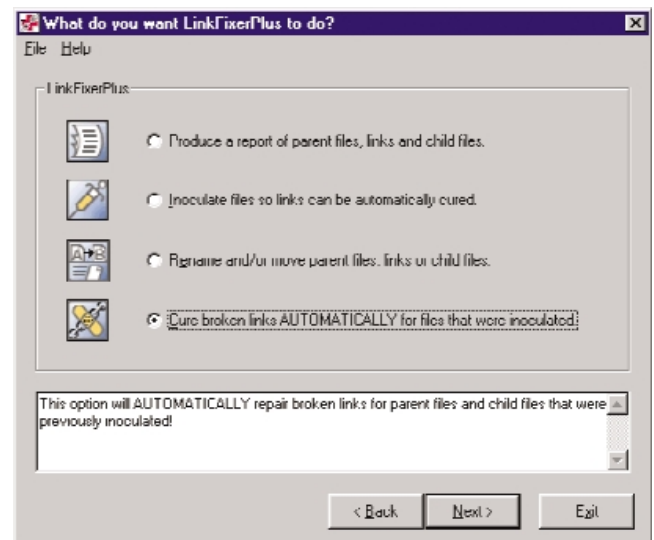

With its introduction, LinkFixerPlus establishes the new software category of "automatic link repair".

Until now, Web professionals have had to rely on programs that merely reported on the condition of links contained within Web sites. However, none of these applications have offered an automatic method of fixing broken links. Repairing link has, until now, been a constant nuisance for Web professionals.

Some HTML editors and Web development packages offer "link checking" as a feature. Yet, the processes these applications employ

are semi-automatic, at best, as they still require the user to manually edit and correct each unique broken link.

LinkFixerPlus is the first and only product to offer an *automatic* solution to the problem of broken links — whether dealing with one, ten or a thousand broken links. LinkFixerPlus will help eliminate the menial task of manually fixing broken links.

LinkFixerPlus' main functions: Inoculate, Cure, Rename/Move and Reports.

#### How does LinkFixerPlus fix broken links automatically?

Fixing broken links automatically is a two step process first involving the "inoculation" of links contained within supported parent file types, and then secondly "curing" any broken links that may be encountered at a later time.

# Product Data Sheet

*LinkFixerPlus* safeguards links contained within the parent files of a local Web site so that when broken links occur due to child files being moved or renamed or due to misspellings within links, they can be repaired quickly and automatically.

It may seem like magic, but using patent-pending technology, *LinkFixerPlus* fixes broken links completely and reliably, by updating the broken links that point to specific child files that were uniquely associated with the parent files during the inoculation process.

Thus using *LinkFixerPlus*, you can speedily, dependably and easily maintain the integrity of all the internal links contained within your Web site files.

## What else can *LinkFixerPlus* do?

In addition to fixing broken links automatically, *LinkFixerPlus* has two other key features:

- **Renaming and moving of files in batch:** *LinkFixerPlus* renames and moves files in batch using sophisticated rename rules without causing broken links. The integrity of each link in a parent file is maintained automatically. You can rename files or entire directories to whatever you want, or you can move files from one directory to another anywhere on your system, without causing any "missing file" errors due to broken links.
- **Detailed reports:** *LinkFixerPlus* generates a variety of detailed reports showing parent files, the links pointing to child files and the status of each of the links. The reports enable you to easily view links contained within supported parent file types and quickly identify which links were found to be broken. Additionally, *LinkFixerPlus* can even check and report on links pointing to external URLs. It can tell the user if external links are valid or broken.

## *LinkFixerPlus* — features at a glance

- Safeguards internal links with the "Inoculate" feature ensuring they can later be fixed automatically.
- Automatically fixes broken links at the touch of a button (after inoculation) using the "Cure" feature.
- Renames and moves files in batch using sophisticated renaming rules without causing a single broken link.
- Generates detailed reports on:

*LinkFixerPlus* offers detailed reports on your Web site's links.

- Broken links contained within local Web sites
- Parent files and their child files — for example, an HTML (parent) file that points to GIF (child) files
- Child files and the parent files that link to them ("cross-reference" reports)
- The integrity of external links within a local Web site
